Bird Beaks
Fill in the Blank

A bird’s beak is very important in helping the animal get food. Complete each sentence below with the correct word.

A short, strong beak allows the chaffinch to crack open nuts and ________ to get the nutrients inside.

A long, pointed ________ helps the woodcock find little creatures, like earthworms and insects, and pluck them from the ground.

Tiny filters inside the flamingo’s beak act like a ________, or strainer, to remove food particles from the water.

A meat-eater beak with a sharp hook on the end helps the kestrel tear its ________ into pieces that can be more easily swallowed.

A beak with a ________ at the end lets the parrot break apart fruit, and a strong base lets it crack open seeds.
Cut out the flashcards, and on the back of each flashcard write a sentence using the vocabulary word. Choose an additional word to make your own with the blank flashcard.
A short, strong beak allows the chaffinch to crack open nuts and seeds to get the nutrients inside.

A long, pointed beak helps the woodcock find little creatures, like earthworms and insects, and pluck them from the ground.

Tiny filters inside the flamingo’s beak act like a sieve, or strainer, to remove food particles from the water.

A meat-eater beak with a sharp hook on the end helps the kestrel tear its prey into pieces that can be more easily swallowed.

A beak with a hook at the end lets the parrot break apart fruit, and a strong base lets it crack open seeds.
